

Access It!® Universal.NET NOTIFY Option

The NOTIFY option sends email notifications for important system events.

The NOTIFY option includes these features:

- SMTP and POP protocol support
- SMS support via email (depending on cellular provider)
- Alphanumeric and numeric pager support
- Notification schedules based on timezones
- Event driven notification down to device level
- Alarm driven notification with custom messages
- Macro driven notification with custom messages
- Macro based group notification to multiple recipients
- Scheduled report generation with ability to email reports in several formats

RS2 Technologies has developed a family of access management software options that can be combined to meet a wide variety of applications. All options are seamlessly integrated with Access It!® Universal.NET for maximum flexibility and ease of use.

NOTIFY Email and Paging Notification Option

The NOTIFY option is a powerful, easy-to-configure and easy-to-use event notification system. It can be configured in a variety of ways to send text notifications via email, pager or SMS texts. These notifications can be set up on a schedule so that notifications are sent only during business hours, or on any specified schedule. NOTIFY is a system-wide (i.e., server-based, not client-based) option, so only one license is needed per system.

Notifications can be triggered either by events, alarms or macros. Default notification messages are sent identifying the event that triggered the notification, the location of the event or alarm, and the date and time that the event occurred. Custom notification messages can also be specified to instruct recipients to call emergency services or other desired actions.

Technical Specifications
